What is Python?

- Python is simple & easy
- Free & Open Source
- High Level Language
- Developed by Guido van Rossum
- Portable

Our First Program

```
print("Hello World")
```

Python Character Set

- Letters – A to Z, a to z
- Digits – 0 to 9
- Special Symbols - + - * / etc.
- Whitespaces – Blank Space, tab, carriage return, newline, formfeed
- Other characters – Python can process all ASCII and Unicode characters as part of data or literals

Variables

A variable is a name given to a memory location in a program.

```
name = "Shifa"

age = 19

price = 25.99
```

Rules for Identifiers

1. Identifiers can be combination of uppercase an lowercase letters, digits or an underscore(_). So myVariable, variable_1, variable_for_print all are valid python identifiers.
2. An Identifier can not start with digit. So while variable1 is valid, 1variable is not valid.
3. We can’t use special symbols like !,#,@,%,$ etc in our identifier.
4. Identifier can be of any length.

Data Types

- Integers
- String
- Float
- Boolean
- Non

Data Types

Print(type(age))	<class ‘int’>
Print(type(pi))	<class ‘float’>
Print(type(complex_num))	<class ‘complex’>
Print(type(A))	<class ‘bool’>
Print(type(name))	<class ‘str’>
